# Vehicle Fuel

Logging fuel and charging for production vehicles

**Scan to open the app**

## Getting started

### Connect to the production

The first screen asks for a production code. Type it in and tap Connect.
The production name then shows at the top of every screen.

### Install it on your phone

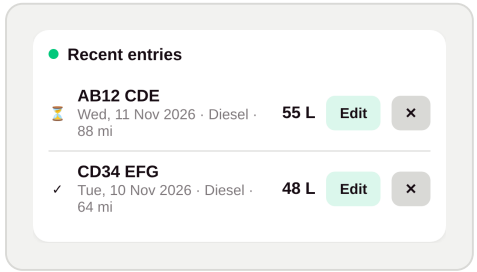

On the same screen, tap Install app, or follow the instructions shown for your phone.
Open Vehicle Fuel from your home screen from then on.

## Logging a fill

1. **Pick the date**
   Today is filled in already.
2. **Choose the vehicle**
   Not on the list? Choose "Other / not listed", type the registration and a description, and leave "Add to the production vehicle list" ticked.
3. **Check the fuel type**
   It fills in by itself for a vehicle already on the list.
4. **Enter the amount**
   Litres for liquid fuel, kWh for charging.
5. **Odometer and distance**
   Both optional. Record them if you have them.
6. **Save the entry**

## What your entries look like

Further down the Log screen you can see what you have saved, and tap Edit to change an entry.

⧖ An hourglass means it has not reached the spreadsheet yet.

✓ A tick means it is on the spreadsheet.

## Good to know

This system is designed to work whether you have signal or not. Keep logging in poor reception, and everything you have saved syncs to the spreadsheet as soon as you are back in range or on Wi-Fi.
